50 years of growth

Existing vs. New Locks

Technical issues with larger ships

- Summary of Recent Casualties
- Technical Challenges
- Regulatory Changes

Notable Casualties

- *MOL Comfort* in 2013 – Structural Failure
- *MSC Napoli* in 2007 – Structural Failure

MOL Comfort

- *MOL Comfort* in June of 2013
 - Passed IACS Longitudinal Strength Requirements
 - High transverse stresses in bottom due to secondary bending between bulkheads
 - Buckling in bottom plating due to biaxial stress
 - May be identified with a 3 Hold Finite Element Analysis such as SafeHull

Hold 5 Bottom Shell and Double Bottom Structure Load Case 4 Displacements and von Mises Stress

V: COMFORT - 1
G: BottomStruct

Output Set: Load Case 4(Total-Full)
Deformed(13.76): Transl Disp.
Criteria: VonMises Stress

MSC Napoli

- *MSC Napoli* in 2007 – Structural Failure
 - Buckling of bottom plating in way of transverse framing at forward end of engine room
 - Buckling checks not carried out along full length of vessel
 - Casualty reports indicate that whipping contributed to damage

IACS - Regulatory Changes

- *Rena*
 - IACS revised longitudinal strength requirements to specifically indicated locations to be checked
- *MOL Comfort*
 - Longitudinal strength requirements updated for containerships (Jul '16)
 - New unified requirements (UR S34) specifies for Load Cases
Finite Element Analysis
 - Minimum extent of FE model will include 3 cargo holds
 - Buckling and yielding to be checked using FEA

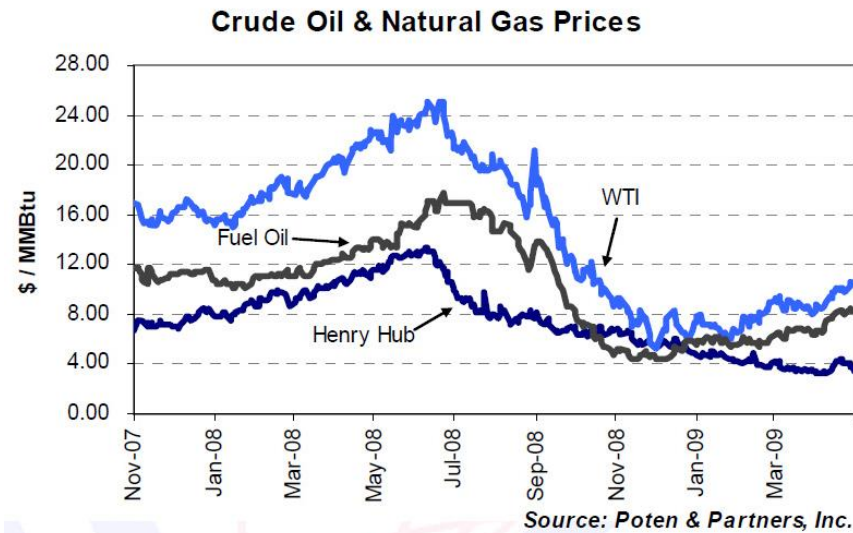

ABS Requirements for Large Containerships

- For containerships with length greater than 350 m
 - *ABS Guide for Slamming Loads and Strength Assessment for Vessels*
 - *Guidance Notes on Whipping Assessment for Container Carriers*
 - *Guidance Notes on Springing Assessment for Container Carriers*
- For vessels using Higher Strength (HT 47) Steel
 - *ABS Guide for Application of Higher-Strength Hull Structural Thick Steel Plates in Container Carriers*
 - Analysis required includes
 - Full ship FE Analysis per ABS Guide for Dynamic Load Analysis
 - ABS Spectral Fatigue Analysis
- *ABS Guide for Enhanced Fire Protection Arrangements, 2013*
 - Optional Notation covering enclosed cargo holds and open decks of container carriers

LNG as Fuel

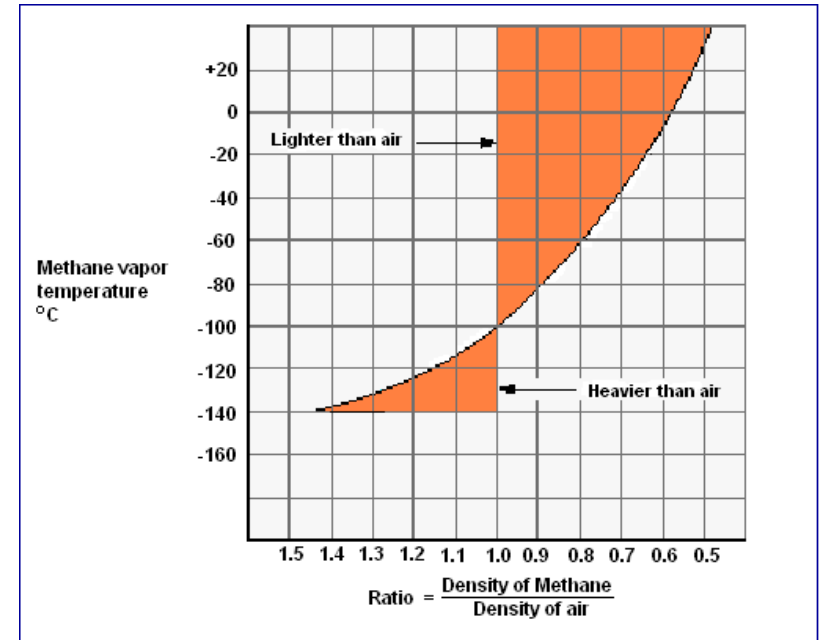

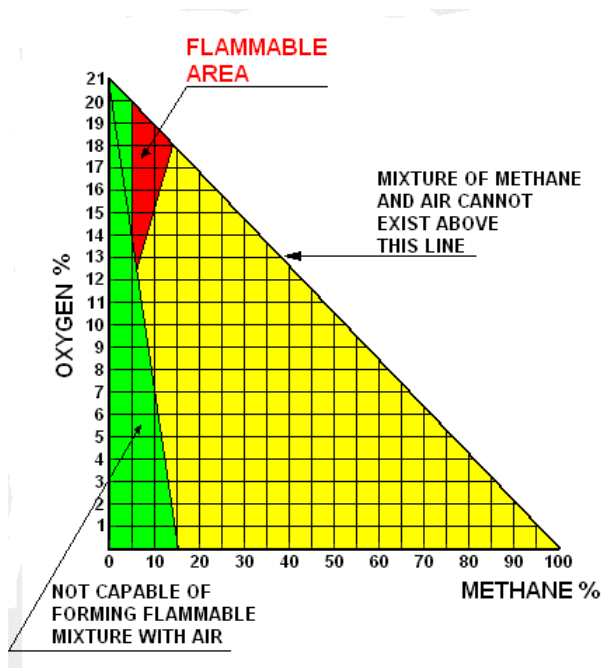

Motivation

- **Emissions**
 - NO_x, SO_x and GHG
- **Economics**
 - Fuel price uncertainty
 - Carbon regulations

Fuel Properties

- Boiling point -163°C at atmospheric pressure
- Critical Temperature – 82°C
- S.G. ~ 0.5
- Liquid and Gas Volume $\sim 1/600$

Fuel Tank Capacity

Gross Calorific Values

- HFO 41.2 MJ/Kg
- LNG 55.5 MJ/Kg

And

Density

- HFO 991 Kg/m³
- LNG 464 Kg/m³

- For the same energy input, LNG need 1.6 times more storage volume (m³)
- Type C tanks with access around tank, it could be 3 to 4 times
- Tank Type is a function of required capacity

Tank Location

Location of Tanks

- Risk of fire in adjacent space causing over pressure
- Risk of leaked flammable product causing fire and explosion
- Risk of leaked cryogenic fluid leading to loss of structural integrity
